Sprint 7 — Operations Center & Capital Recycling — Final plan

claude/sprint7-operations-center	Branch
claude/sprint6-portals	Stacked on
rewrite + 2 new screens + 1 form extension 1	Scope
None — reuse existing investment + installment flows	New module
In-memory mock store only	Persistence
Prototype · not merged to main	Status

Product principle for Sprint 7

The Operations Center is **today's work queue**, not an enterprise command center. Every screen earns its place by leading directly to an action. No analytics, no charts, no embedded filters or large tables. Mobile-readable in seconds

- أمثلة على ما يظهر في الرئيسية:
- 5 أقساط متأخرة
- 3 إيصالات بانتظار المراجعة
- 11,000 ر.س جاهزة لإعادة التشغيل
- 2 موافقات قيد الانتظار

Operations Center home — /operations

A single lean column. **Four primary action cards**, each one card, each with one count + one amount + one CTA

CTA → destination	Surface	Card	#
collections/	عدد عملاء · المبلغ الإجمالي	أقساط متأخرة	1
collections/whatsapp/	عدد إيصالات · منها بدقة OCR منخفضة	إيصالات بانتظار المراجعة	2
approvals/	عدد الطلبات · منها حرجة	موافقات قيد الانتظار	3
operations/recycle/	المبلغ الإجمالي · عدد المستثمرين	رأس مال جاهز لإعادة التشغيل	4

:Below those, **one lighter secondary tile** (smaller, less visual weight) for informational follow-up

- عقود قريبة من الانتهاء — n خلال 30 يوم → [investments/](#)

.Nothing else on the page. No charts. No filters. No embedded customer lists. No KPI strip on top

Capital recycling — operator-controlled, lightweight

The principle

e.g. 11,000) When collected installments for an investor reach the investor's configured recycling threshold the office can create a **new recycled investment contract**. The office sets the new investment (ر.س),

percentage at recycling time — it is not auto-calculated. The recycled amount becomes a new investment contract that appears in the investor picker when creating future installment contracts

Why this is a competitive advantage

- .Small offices do not need to wait for the original contract to end
- .Collected capital cycles back into financing quickly
- .The office stays in full control — no automatic allocation engine

Recycle list — /operations/recycle

- .One row per investor whose collected amount has crossed the threshold
- .button تشغيل الآن · Row shows: investor name · ready amount · threshold pill
- .Empty state explains the threshold rule plainly
- .No source contract numbers shown

Recycle confirmation — /operations/recycle/[contractId]

:A short form, intentionally small

- 1. **Header (read-only):** investor name + collected amount (large readable number)
- 2. **Single input:** نسبة المكتب لهذه الدورة (%) — number input with +/- stepper, 0–100
- 3. **Live preview** updates as the operator types

$$\text{financingAmount} = \text{collectedAmount} \times (1 - \text{pct} / 100)$$

- متاح للتمويل — .becomes the new contract's principal
- نصيب المكتب — .informational only
- 4. **One button:** تشغيل الآن . Disabled until percentage is entered
- .No customer picker. No allocation grid. No source contract reference on screen

Example

المبلغ المُحصَّل	15,000 ر.س
نسبة المكتب (إدخال)	10%
متاح للتمويل	13,500 ر.س ← مبدأ العقد الجديد
نصيب المكتب	1,500 ر.س

What "تشغيل الآن" does

Calls a single mock store action `createRecycledContract(sourceId, percentage)` that creates a new `InvestmentContract` with

Field	Value
amount	financing amount (principal)
operationPct	the percentage the operator entered
sourceContractId	the source (internal only)
recyclingCycle	1 (internal only) + (source's cycle ?? 0)
recycledFromCollected	the collected amount (informational)
recyclingOfficeMargin	office share (informational)
number	source-number>-R1 (or R2, R3...)>
investorId , capitalRecyclingEnabled , threshold	inherited from source
timeline	one entry : "إعادة تدوير"

.Then redirects to the new contract's detail page

Data model — minimal extension

:Four optional fields added to `InvestmentContract`

- `sourceContractId?: string`
- `recyclingCycle?: number`
- `recycledFromCollected?: number`
- `recyclingOfficeMargin?: number`

.All optional. Existing contracts ignore them. No new entity. No new module

Investor picker — extend the existing `/contracts/new` flow

- .Sort active investment contracts by `remaining` (available financing) **descending**
- Show `مناح للتمويل: X ر.س` inline on each row

- Recycled contracts render with a small  badge
- No source contract reference shown. No chain hierarchy. No breadcrumb
- Sprint 3 flow otherwise unchanged. No new screen

Recycled contract detail — light UI extension

The existing `/investments/[id]` page, with one extra block when `sourceContractId` is set

- badge next to the contract number 
- Three small info rows below the principal block
 - المبلغ المُحصَّل قبل النسبة
 - نصيب المكتب
 - متاح للتمويل
- No source contract link. No chain breadcrumb. The badge is enough

Out of scope (reaffirmed)

- No separate recycling module / engine / analytics / charts
- No history log beyond the internal badge
- No customer picker during recycling
- No batch recycling across investors
- No new approval rules
- No persistence beyond the in-memory mock store session
- No source-contract surfacing in the UI (kept internal-only for tracking)

File changes — estimated 9 touch points

1. `lib/mock/types.ts` — extend `InvestmentContract` with 4 optional fields
2. `lib/mock/store.tsx` — add `createRecycledContract` action + selectors for ready-to-recycle
3. `app/(app)/operations/page.tsx` — rewrite as lean Today view
4. `app/(app)/operations/recycle/page.tsx` — list of source contracts ready
5. `app/(app)/operations/recycle/[contractId]/page.tsx` — the confirmation form
6. `app/(app)/contracts/new/page.tsx` — sort + inline amount + badge in investor picker

- . `app/(app)/investments/[id]/page.tsx` — show recycled metadata block when present .7
- . `components/ui/recycled-badge.tsx` — one tiny component reused everywhere .8
- . `*. lib/il8n/dictionaries.ts` — replace `operations.*` , add `recycling` .9
- . /Plus review pack screenshots + PDF in `docs/review/sprint7-operations-center`

Verification before shipping

- ✓ `pnpm --filter @muqsit/web type-check` •
- ✓ `pnpm --filter @muqsit/web lint` •
- ✓ `pnpm --filter @muqsit/web build` •
- . Visual screenshots ✓ — mobile + desktop, AR + EN, light + dark •

Closing principle

.Muqsit succeeds through simplicity, clarity, and operational speed — not through feature quantity
The recycling feature is a competitive operational advantage — not a reason to increase product
complexity
